# 2014

# **Trial HSC Examination**

# Mathematics Extension I

### **General Instructions**

- Reading time 5 minutes
- Working time 2 hours
- Write using black or blue pen (Black pen is preferred)
- Board-approved calculators may be used
- A table of standard integrals is provided at the back of this paper
- In Questions 11–14, show relevant mathematical reasoning and/or calculations

#### Total marks – 70

Section I Pages 2 – 4

#### 10 marks

- Attempt Questions 1–10
- Allow about 15 minutes for this section

# **Section II** Pages 5 – 8 **60 marks**

- Attempt Questions 11–14
- Allow about 1 hour and 45 minutes for this section

## Question 1 - 10 (1 mark each) Answer on page provided.

- The remainder when  $P(x) = 2x^3 + x^2 5x 3$  is divided by x + 1 is: 1)
  - A) -3
- B) -5 C) 1
- D) -1

- 2)  $\int \frac{1}{3+x^2} dx$  is given by:
  - A)  $\tan^{-1}\sqrt{3}x + c$

 $B) \qquad \frac{1}{3} \tan^{-1} \frac{x}{3} + c$ 

 $C) \qquad \frac{1}{3} \tan^{-1} 3x + c$ 

- D)  $\frac{1}{\sqrt{3}} \tan^{-1} \frac{x}{\sqrt{3}} + c$
- Given the function f(x):  $y = \frac{2}{x+1}$ , then its inverse function 3)  $f^{-1}(x)$  in terms of x is given by:
  - $A) y = \frac{2-x}{x}$

 $B) y = \frac{x+1}{2}$ 

C)  $y = \frac{2 - x}{2}$ 

D)  $y = \frac{2 + x}{r}$ 

- $\lim_{x \to 0} \frac{\sin 3x}{x}$  is equal to:

  - A) 1 B)  $\frac{1}{3}$
- C) -3
- D) 3

The solution to the equation  $3^{x-1} = 5$  is given by: 5)

$$A) \qquad x = \frac{\ln 5}{\ln 3} + 1$$

B) 
$$x = \frac{\ln 5}{\ln 3} - 1$$

$$C) \qquad x = \frac{\ln 3}{\ln 5} + 1$$

$$D) \qquad x = \frac{\ln 3}{\ln 5} - 1$$

The general solution to the equation  $2\sin\theta = \sqrt{3}$  is given by: 6)

A) 
$$\theta = k\pi + \frac{\pi}{3}$$

B) 
$$\theta = k\pi + \left(-1\right)^k \frac{\pi}{3}$$

C) 
$$\theta = k\pi + \left(-1\right)^k \frac{\pi}{6}$$

D) 
$$\theta = 2k\pi \pm \frac{\pi}{3}$$

If two of the roots of  $2x^3 - gx^2 + hx - 8 = 0$  are -1 and 2, the other root is: 7)

If  $f(x) = \sin^2(3-x)$ , then f'(0) is equal to: 8)

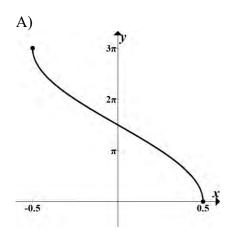

A) 
$$-2\cos(3)$$

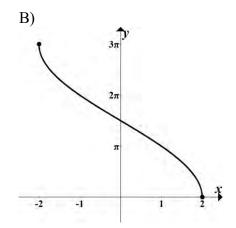

B) 
$$-2\sin(3)\cos(3)$$

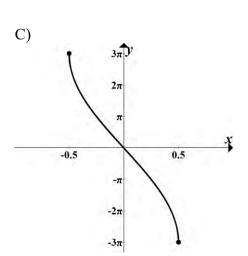

C) 
$$2\sin(3)\cos(3)$$

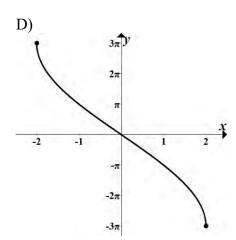

$$D) \qquad 6\sin(3)\cos(3)$$

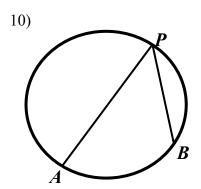

9) The graph of  $y = 3\cos^{-1}\left(\frac{x}{2}\right)$  is:

AP is a diameter of the circle.

If  $\angle APB = 40^{\circ}$ , then  $\angle PAB$  is:

A) 60°

B) 40°

C) 50°

D) not enough information

#### **Section II**

#### 60 marks

#### Attempt all questions 11-14

#### Allow about 1 hour and 45 minutes for this section

Answer each question in a SEPARATE writing booklet. Extra writing booklets are available.

In Questions 11–14, your responses should include relevant mathematical reasoning and/or calculations.

Question 11 (15 marks) Start a NEW booklet.

Marks

a) Solve 
$$\frac{2x}{x-1} < 3$$
.

- b) Find the acute angle between the lines x-2y+3=0 and 3x+y+6=0. 2

  [Answer to the **nearest degree**]
- c) Use the substitution  $t = \tan \frac{\theta}{2}$  to express  $1 + \tan \theta \tan \frac{\theta}{2}$  as a fraction 2 in simplest form.
- d) Find  $\int \sin^2 x \, dx$ .
- e) Given that a root of  $y=3x+\ln x-1$  lies close to x=0.4, use Newton's method 2 once to find an improved value of that root correct to 2 decimal places.
- f) Solve  $\cos 2\theta = \cos \theta$  where  $0 \le \theta \le 2\pi$ .
- g) i) Write down the expansion of sin(A-B).
  - ii) Hence show that  $\sin 15^\circ = \frac{\sqrt{6} \sqrt{2}}{4}$ .

# Question 12 (15 marks) Start a NEW booklet.

Marks

a) The variable point  $(3t, 4t^2)$  lies on a parabola.

2

Find the cartesian equation of this parabola.

b) Find the domain of  $y = \ln(\sin^{-1} x)$ .

2

- c) Consider the function  $f(x) = \frac{3x}{x^2 1}$ .
  - i) Show that the function is odd.

1

ii) Show that the function is decreasing for all values of x.

2

iii) Neatly sketch the graph of  $f(x) = \frac{3x}{x^2 - 1}$  showing clearly the equations of any asymptotes.

2

d) Use the substitution  $u = x^2 - 2$  to evaluate  $\int_{\sqrt{3}}^{\sqrt{11}} \frac{x}{\sqrt{x^2 - 2}} dx$ 

3

e) At time t hours after an oil spill occurs, a circular oil slick has a radius of 'r' kilometres, where  $r = \sqrt{t+1} - 1$ .

3

Find the rate at which the area of the slick is increasing when the radius is 1 kilometre.

Question 13 (15 marks) Start a NEW booklet.

Marks

- a) Find the exact value of  $\cos\left(\sin^{-1}\left(\frac{3}{4}\right)\right)$ .
- b) i) Given that A > 0 and  $0 < \alpha < \frac{\pi}{2}$ , show that when  $\cos x \sin x$  2 is expressed in the form  $A\cos(x + \alpha)$ , that  $A = \sqrt{2}$  and  $\alpha = \frac{\pi}{4}$ .
  - ii) Hence solve  $\cos x \sin x = \frac{1}{\sqrt{2}}$  for  $0 \le x \le 2\pi$ .
- c) A cake is cooling after being taken out of the oven. The surrounding temperature in the room is  $20^{\circ}C$ .

At a time 't' minutes, its temperature T decreases according to the equation  $\frac{dT}{dt} = -k(T-20)$  where 'k' is a positive constant. The initial temperature of the cake immediately after removal from the oven was  $180^{\circ}C$  and it cools to  $120^{\circ}C$  after 5 minutes.

- i) Show that  $T = 20 + Ae^{-kt}$  is a solution to  $\frac{dT}{dt} = -k(T 20)$ , where 1

  A is a constant.
- ii) Find the values of A and k.
- iii) How long will it take for the cake to cool to  $60^{\circ}C$ ? 2

  (Answer to the nearest minute)

Question 13 continued. Marks

- d) The two points  $P(2ap, ap^2)$  and  $Q(2aq, aq^2)$  are on the parabola  $x^2 = 4ay$ .
  - i) Show that the equation of the tangent at P is given by  $y = px ap^2$ .
  - ii) The tangents at P and Q meet at T. 2

    Show that T has coordinates  $\left[a(p+q), apq\right]$ .
  - iii) P and Q move in such a way that  $\angle POQ$  is always 90°. ( O is the origin). 1 Show that pq = -4.
  - iv) Hence deduce the locus of T.

End of Question 13.

Question 14 (15 marks) Start a NEW booklet.

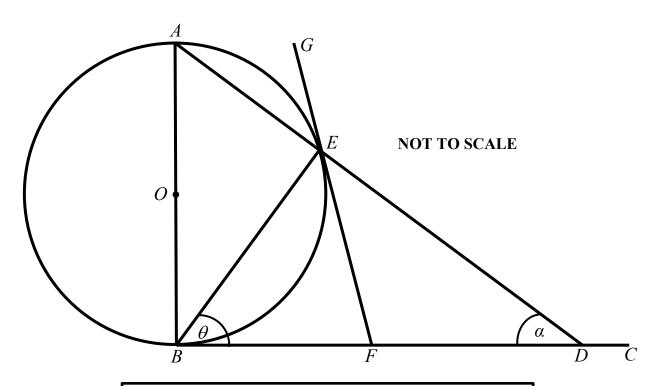

Marks

- a) The polynomial  $P(x) = 4x^3 + kx + 6$  has (x+3) as a factor. 2

  Find the value of k and express P(x) in the form (x+3)Q(x).
- b) In the diagram below, AB is the diameter of the circle centre O, and BC is tangential to the circle at B.

The line AD intersects the circle at E and BC at D. The tangent to the circle at E intersects BC at F.

Let  $\angle EBF = \theta$  and  $\angle EDF = \alpha$ .

# Answer this question on the page provided

i) Prove that 
$$\angle FED = \frac{\pi}{2} - \theta$$

ii) Prove that 
$$BF = FD$$
.

# Question 14 continues on the next page

Question 14 continued.

Marks

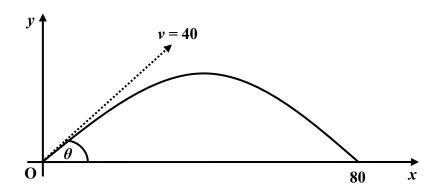

c) Prove by Mathematical Induction that

3

$$1 \times 3 + 2 \times 3^{2} + \dots + n \times 3^{n} = \frac{(2n-1)3^{n+1} + 3}{4}$$

where n is an integer,  $n \ge 1$ .

d)

An arrow fired from ground level at a velocity of 40 m/s, is to strike the ground 80 metres away as shown in the diagram above.

- i) Show that the vertical and horizontal displacement equations are given 2 respectively by:  $y = 40t\sin\theta 5t^2$  and  $x = 40t\cos\theta$ . (Assume  $g = 10 \text{ m/s}^2$ )
- ii) Hence, find the two angles at which the arrow can be fired.

#### END OF EXAM

Candidate Name/Number:					
Multiple choice answer page. Fill in either A, B, C or D for questions 1-10.					
This page must be handed in with your answer booklets					
	1.			6.

	4.			9.	
	5.			10.	

# Question 14b (additional diagram) Candidate Name/Number: \_\_\_\_\_ NOT TO SCALE OHand this page in inside the Question 14 booklet

#### STANDARD INTEGRALS

$$\int x^n dx = \frac{1}{n+1} x^{n+1}, \quad n \neq -1; \quad x \neq 0, \text{ if } n < 0$$

$$\int \frac{1}{x} dx = \ln x, \quad x > 0$$

$$\int e^{ax} dx = \frac{1}{a} e^{ax}, \quad a \neq 0$$

$$\int \cos ax dx = \frac{1}{a} \sin ax, \quad a \neq 0$$

$$\int \sin ax dx = -\frac{1}{a} \cos ax, \quad a \neq 0$$

$$\int \sec^2 ax dx = \frac{1}{a} \tan ax, \quad a \neq 0$$

$$\int \sec ax \tan ax dx = \frac{1}{a} \sec ax, \quad a \neq 0$$

$$\int \frac{1}{a^2 + x^2} dx = \frac{1}{a} \tan^{-1} \frac{x}{a}, \quad a \neq 0$$

$$\int \frac{1}{\sqrt{a^2 - x^2}} dx = \sin^{-1} \frac{x}{a}, \quad a > 0, \quad -a < x < a$$

$$\int \frac{1}{\sqrt{x^2 - a^2}} dx = \ln \left( x + \sqrt{x^2 - a^2} \right), \quad x > a > 0$$

$$\int \frac{1}{\sqrt{x^2 + a^2}} dx = \ln \left( x + \sqrt{x^2 + a^2} \right)$$

NOTE:  $\ln x = \log_e x$ , x > 0

#### **Multiple Choice Section:**

5.A

#### Question 1.

The remainder is given by P(-1)

$$=2(-1)+1-5(-1)-3=1$$

#### **Question 2.**

$$\int \frac{1}{3+x^2} dx = \int \frac{1}{\sqrt{3^2+x^2}} dx$$

$$\frac{1}{\sqrt{3}}\tan^{-1}\frac{x}{\sqrt{3}}+c$$

#### Question 3.

$$f(x)$$
:  $y = \frac{2}{x+1} \rightarrow f^{-1}(x)$ :  $x = \frac{2}{y+1}$ 

$$\therefore xy + x = 2 \rightarrow xy = 2 - x$$

$$\therefore \quad y = \frac{2-x}{x}$$

#### Question 4.

$$\lim_{x \to 0} \frac{\sin 3x}{x} = 3 \lim_{x \to 0} \frac{\sin 3x}{3x}$$

$$= 3 \times 1 = 3$$

# $= 3 \times 1 = 3$

#### **Question 5.**

$$3^{x-1} = 5 \to x - 1 = \log_3 5$$

$$\therefore x = 1 + \log_3 5$$

$$= 1 + \frac{\ln 5}{\ln 3}$$

#### **Question 6.**

$$\sin \theta = \frac{\sqrt{3}}{2} \rightarrow \text{Acute angle } \theta = \frac{\pi}{3}$$

$$\therefore \ \theta = k\pi + \left(-1\right)^k \frac{\pi}{3} \qquad \qquad -----\underline{B}$$

#### Question 7.

product of roots = 
$$\frac{-d}{a}$$

$$\therefore -1 \times 2 \times \alpha = \frac{-(-8)}{2} = 4$$

$$\therefore \alpha = -2 \qquad \qquad ----- \boxed{A}$$

#### **Question 8.**

$$f(x) = \sin^2(3-x) \rightarrow f'(x) = -2\sin(3-x)\cos(3-x)$$

$$f'(0) = -2\sin(3)\cos(3)$$
 -----B

#### Question 9.

Domain: 
$$-1 \le \frac{x}{2} \le 1 \rightarrow -2 \le x \le 2$$

Range:  $0 \le y \le 3\pi$ 

#### Question 10.

$$\angle PBA = 90^{\circ} \{ \angle \text{ in semi} - \text{circle} \}$$

Given 
$$\angle APB = 40^{\circ} \rightarrow \angle PAB = 50^{\circ} \{\angle sum \triangle APB\}$$

#### Question 11.

a) CV1: 
$$2x = 3(x-1) \rightarrow x = 3$$

CV2: 
$$x = 1$$

On testing x < 1 and x > 3, note  $x \ne 1$ 

#### **Ouestion 11 continued.**

b) 
$$x - 2y + 3 = 0 \rightarrow m_1 = \frac{1}{2}$$
  
 $3x + y + 6 = 0 \rightarrow m_2 = -3$ 

$$\therefore \tan \theta = \left| \frac{\frac{1}{2} - (-3)}{1 + \frac{1}{2} \times (-3)} \right| = 7$$

$$\therefore \theta = 81^{\circ}52'(NOTE: accept 82^{\circ})$$

c) 
$$1 + \tan \theta \tan \frac{\theta}{2} = 1 + \frac{2t}{1 - t^2} \times t$$

$$= \frac{1 - t^2 + 2t^2}{1 - t^2}$$

$$= \frac{1 + t^2}{1 - t^2}$$

d) 
$$\cos 2x = 1 - 2\sin^2 x \rightarrow \sin^2 x = \frac{1}{2}(1 - \cos 2x)$$
  

$$\therefore I = \frac{1}{2}\int 1 - \cos 2x \, dx$$

$$= \frac{1}{2}\left(x - \frac{1}{2}\sin 2x\right) + c$$

$$= \frac{x}{2} - \frac{1}{4}\sin 2x + c$$

e) Let 
$$P(x) = 3x + \ln x - 1 \rightarrow P'(x) = 3 + \frac{1}{x}$$

$$a_1 = a_0 - \frac{P(a_0)}{P'(a_0)} \left( Newton's \ method \right)$$

$$P(0.4) = -0.7163; P'(0.4) = 5.5$$

$$\therefore a_1 = 0.4 - \frac{-0.7163}{5.5}$$
$$\approx 0.53(2 dp)$$

f) 
$$2\cos^2\theta - 1 = \cos\theta$$

$$\therefore 2\cos^2\theta - \cos\theta - 1 = 0$$
$$(2\cos\theta + 1)(\cos\theta - 1) = 0$$

$$\therefore \cos \theta = -\frac{1}{2} \text{ and } \cos \theta = 1$$

$$\therefore \theta = \frac{2\pi}{3}, \frac{4\pi}{3}, 0, 2\pi$$

g) i) 
$$\sin(A-B) = \sin A \cos B - \sin B \cos A$$

ii) 
$$\sin(45^{\circ}-30^{\circ}) = \sin 45^{\circ} \cos 30^{\circ} - \sin 30^{\circ} \cos 45^{\circ}$$
  

$$\therefore \sin 15^{\circ} = \frac{1}{\sqrt{2}} \times \frac{\sqrt{3}}{2} - \frac{1}{2} \times \frac{1}{\sqrt{2}}$$

$$= \frac{\sqrt{3}-1}{2\sqrt{2}} \times \frac{\sqrt{2}}{\sqrt{2}}$$

$$= \frac{\sqrt{6}-\sqrt{2}}{4}.$$

*Note*: Could also use  $\sin(60^{\circ} - 45^{\circ})$ 

#### **Question 12.**

a) 
$$x = 3t \rightarrow t = \frac{x}{3}$$

$$\therefore y = 4t^2 \quad \to \quad y = 4\left(\frac{x}{3}\right)^2$$

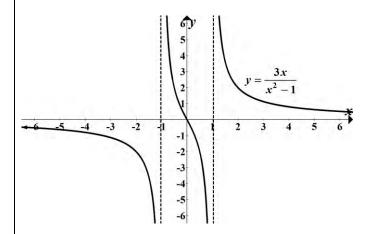

$$\therefore y = \frac{4x^2}{9} \text{ or } 4x^2 = 9y$$

- b) For  $\sin^{-1} x$ :  $D: -1 \le x \le 1$ and for  $\ln(x)$ : D: x > 0
- $\therefore$  for  $\ln(\sin^{-1} x)$ :  $D: 0 < x \le 1$
- c) i) A function is odd if f(-x) = -f(x)  $f(x) = \frac{3x}{x^2 - 1} \rightarrow f(-x) = \frac{3(-x)}{(-x)^2 - 1}$  $= \frac{-3x}{x^2 - 1} = -f(x)$
- ii) A function is decreasing if f'(x) < 0 for all x

$$f'(x) = \frac{(x^2 - 1) \times 3 - 3x \times 2x}{(x^2 - 1)^2}$$
$$= \frac{-3(x^2 + 1)}{(x^2 - 1)^2} < 0 \text{ for all } x$$

#### **Ouestion 12 continued:**

c) iii) Vertical asymptotes at  $x = \pm 1$ Horizontal asymptote at y = 0 (x-axis)

$$d) u = x^2 \rightarrow du = 2x dx$$

When  $x = \sqrt{3}$ , u = 1;  $x = \sqrt{11}$ , u = 9

$$I = \frac{1}{2} \int_{1}^{9} \frac{1}{\sqrt{u}} du = \frac{1}{2} \int_{1}^{9} u^{-1/2} du$$
$$= \frac{1}{2} \left[ 2u^{1/2} \right]_{1}^{9} = 3 - 1 = 2$$

e) 
$$A = \pi r^2$$
;  $r = \sqrt{t+1} - 1 \rightarrow r + 1 = \sqrt{t+1}$ 

$$\frac{dA}{dt} = \frac{dA}{dr} \times \frac{dr}{dt} \text{ [chain rule]}$$

$$= 2\pi r \times \frac{1}{2} (t+1)^{-1/2}$$

$$= \pi r \times \frac{1}{\sqrt{(t+1)}}$$

$$\therefore \quad \frac{dA}{dt} = \pi r \times \frac{1}{r+1}$$

and when r = 1:

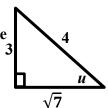

$$\therefore \frac{dA}{dt} = \pi \times 1 \times \frac{1}{1+1} = \frac{\pi}{2} km/h$$

#### **Question 13.**

a) Let  $u = \sin^{-1}\left(\frac{3}{4}\right)$  and evaluate  $\cos u$ 

$$u = \sin^{-1}\left(\frac{3}{4}\right) \rightarrow \sin u = \frac{3}{4}$$

 $\cos u = \sqrt{1 - \sin^2 u} \quad \text{or use a triangle}$   $= \sqrt{1 - \frac{9}{16}} = \sqrt{\frac{7}{16}}$ 

$$\therefore \cos u = \frac{\sqrt{7}}{4} = \cos \left( \sin^{-1} \left( \frac{3}{4} \right) \right)$$

b) i) Let  $\cos x - \sin x = A\cos(x + \alpha)$ 

 $= A\cos\alpha\cos x - A\sin\alpha\sin x$ 

Equating coefficients of  $\cos x$  and  $\sin x$  gives:

$$A\cos\alpha = 1 - - - \boxed{1}$$
 and  $A\sin\alpha = 1 - - - \boxed{2}$ 

$$\boxed{1}^2 + \boxed{2}^2 \rightarrow A^2(\cos^2 x + \sin^2 x) = 2$$

$$\therefore A^2 = 2 \rightarrow A = \sqrt{2}$$

Using  $\boxed{1}$  with  $A = \sqrt{2} \rightarrow \cos \alpha = \frac{1}{\sqrt{2}}$ 

$$\therefore \quad \alpha = \frac{\pi}{4}$$

ii) 
$$\cos x - \sin x = \frac{1}{\sqrt{2}}$$

$$\therefore \sqrt{2}\cos\left(x+\frac{\pi}{4}\right) = \frac{1}{\sqrt{2}} \quad \to \quad \cos\left(x+\frac{\pi}{4}\right) = \frac{1}{2}$$

$$\therefore x + \frac{\pi}{4} = \frac{\pi}{3}, \frac{5\pi}{3}$$

hence 
$$x = \frac{\pi}{12}, \frac{17\pi}{12}$$

c) i) 
$$T = 20 + Ae^{-kt} \rightarrow Ae^{-kt} = T - 20$$

$$LHS = \frac{d(20 + Ae^{-kt})}{dt}$$
$$= -kAe^{-kt}$$

$$= -k(T - 20) = RHS$$

cii) when 
$$t = 0, T = 180^{\circ}; t = 5, T = 120^{\circ}$$

$$180 = 20 + Ae^0 \rightarrow A = 160$$

also 
$$120 = 20 + 160e^{-5k}$$

$$\therefore \quad \frac{10}{16} = e^{-5k} \quad \to \quad -5k = \ln\left(\frac{5}{8}\right)$$

$$\therefore \quad k = -\frac{1}{5} \ln \left( \frac{5}{8} \right) \quad \to \quad k \approx 0.094$$

ii) 
$$60 = 20 + 160e^{-kt}$$

$$\therefore \frac{1}{4} = e^{-0.094t}$$

$$\therefore \ln\left(\frac{1}{4}\right) = -0.094t \quad \to \quad t \approx 15 \,\text{minutes}$$

d) i) 
$$y = \frac{x^2}{4a} \rightarrow m = \frac{dy}{dx} = \frac{x}{2a}$$

At 
$$P: m = \frac{2ap}{2a} = p$$

hence 
$$y - ap^2 = p(x - 2ap)$$

$$y - ap^2 = px - 2ap^2$$

$$\therefore y = px - ap^2$$

ii) 
$$y = px - ap^2 - - - \boxed{1}$$
  
at  $Q: y = ax - aa^2 - - - \boxed{2}$ 

$$\boxed{1} = \boxed{2} \quad \rightarrow \quad px - ap^2 = qx - aq^2$$

$$\therefore px - qx = ap^2 - aq^2$$

$$x(p-q) = a(p-q)(p+q)$$

$$\therefore x = a(p+q)$$

hence  $y = p \times a(p+q) - ap^2 = apq$ 

$$T[a(p+q), apq]$$

iii) since
$$\angle POQ = 90^{\circ}$$
,  $m_{OP} \times m_{OQ} = -1$ 

$$\therefore \frac{ap^2}{2ap} \times \frac{aq^2}{2aq} = -1$$

$$\therefore \frac{p}{2} \times \frac{q}{2} = -1 \quad \rightarrow \quad pq = -4$$

iv) Since 
$$pq = -4$$
  
 $y = apq \rightarrow y = -4a$   
which is the locus of  $T$ .

#### Question 14.

a) 
$$P(x) = 4x^3 + kx + 6$$
  
 $P(-3) = 0 \rightarrow -108 - 3k + 6 = 0$ 

so 
$$P(x) = 4x^3 - 34x + 6$$

$$\therefore 4x^3 - 34x + 6 = (x+3)(4x^2 + bx + 2)$$

on equating coefficients of  $x^2$ :

$$0 = b + 12 \quad \rightarrow \quad b = -12$$

$$P(x) = (x+3)(4x^2-12x+2)$$

## **Note:**[or use long division]

b) i) 
$$\angle AEB = 90^{\circ} [\angle \text{ in semi-circle}]$$

BF = FE [tangents from external point equal]

 $\therefore \Delta FBE$  is isosceles

 $\therefore$   $\angle FEB = \theta$  [ $\angle$ 's opposite equal sides in isos  $\Delta$ ] and since  $\angle$   $BED = 90^{\circ}$ , then

$$\angle FED = 90^{\circ} - \theta = \frac{\pi}{2} - \theta$$
.

ii) Using 
$$\triangle ABD$$
:  $\alpha = 180^{\circ} - \angle ABD - \angle BAD$   
=  $180^{\circ} - 90^{\circ} - \theta$   
=  $90^{\circ} - \theta$  or  $\left(\frac{\pi}{2} - \theta\right)$ 

 $\therefore \Delta FED$  is isosceles with FE = FD [sides opposite equal  $\angle$ 's in isos  $\Delta$ ]

and also since FE = BF, then BF = FD.

c) 
$$1 \times 3 + 2 \times 3^2 + \dots + n \times 3^n = \frac{(2n-1)3^{n+1} + 3}{4}$$

When 
$$n = 1$$
:  $LHS = 1 \times 3 = 3$ 

$$RHS = \frac{\left(2 \times 1 - 1\right) \times 3^2 + 3}{4}$$

$$=\frac{9+3}{4}=3$$
 : true for  $n=1$ .

#### **Ouestion 14 continued:**

Assume true for n = k: i.e.

$$1 \times 3 + 2 \times 3^2 + \dots + k \times 3^k = \frac{(2k-1)3^{k+1} + 3}{4}$$

Prove true for n = k:

i.e. 
$$S_k + T_{k+1} = S_{k+1}$$

$$S_k = \frac{(2k-1)3^{k+1} + 3}{4}$$
;  $S_{k+1} = \frac{(2k+1)3^{k+2} + 3}{4}$ ;  $T_{k+1} = (k+1) \times 3^{k+1}$ 

$$LHS = \frac{(2k-1)3^{k+1} + 3}{4} + (k+1) \times 3^{k+1}$$
$$= \frac{(2k-1)3^{k+1} + 3 + 4(k+1) \times 3^{k+1}}{4}$$

$$=\frac{3^{k+1}(2k-1+4(k+1))+3}{4}$$

$$=\frac{3^{k+1}(6k+3)+3}{4}$$

$$= \frac{(2k+1) \times 3 \times 3^{k+1} + 3}{4}$$

$$=\frac{(2k+1)\times 3^{k+2}+3}{4}$$

$$=S_{k+1}=RHS$$

 $\therefore$  If true for n = k, then true for n = k + 1.

Hence by the principle of mathematical induction, the result is true for all  $n \ge 1$ .

d) i) 
$$t = 0$$
,  $y = 0$ ,  $\dot{y} = 40 \sin \theta$ ,  $x = 0$ ,  $\dot{x} = 40 \cos \theta$ 

Vertically: 
$$y = -10 \rightarrow y = -10t + c$$
  
 $t = 0, y = 40\sin\theta \rightarrow c = 40\sin\theta$   
 $\therefore y = 40\sin\theta - 10t$   
 $\therefore y = 40t\sin\theta - 5t^2 + c$ 

$$0 = 40\sin\theta \times 0 - 5 \times 0 + c \quad \rightarrow \quad c = 0$$
  
 
$$\therefore y = 40t\sin\theta - 5t^2$$

Horizontally: 
$$x = 0 \rightarrow x = 40 \cos \theta$$
  
 $\therefore x = 40t \cos \theta + c$   
 $0 = 40 \cos \theta \times 0 + c \rightarrow c = 0$   
 $\therefore x = 40t \cos \theta$ 

- ii) When y = 0,  $0 = t(40 \sin \theta 5t)$
- $\therefore$  when it strikes the ground  $t = 8\sin\theta$

$$\therefore$$
 when  $t = 8 \sin \theta$ ,  $x = 80$ 

$$\therefore 80 = 40\cos\theta \times 8\sin\theta$$

$$\frac{1}{2} = 2\sin\theta\cos\theta$$

$$\frac{1}{2} = \sin 2\theta$$

$$\therefore 2\theta = 30^{\circ}, 180^{\circ} - 30^{\circ}$$

hence the two angles are 15° and 75°.
